

With the Eason array upload/download function in Winbuild 2000, you can manage large arrays on the unit by uploading them into Excel on your PC.

Edit the file, and then redownload new data back to the unit!

The file is stored in comma separated format (CSV) that you can edit in any text editor or Excel.

Keep in mind this is a lot like our RECIPE SYSTEM which can also upload and download arrays and data setups from an EXCEL file.
